Summary

An orc skull dual coat hanger for my kids. Mountable with two 4mm countersink wood screws (8mm head).

This is a coat hanger in the shape of an orc skull, which can be mounted to the wall. I made it for my kids after building a new coat rack. It is based on [RavenCrowe Minis' "FREE Orc Skull"](#).

Printing

For maximum strength, print it laying on the back. Increase the infill density for the forehead and the horn (see the modifier mesh in the .3mf file).

You will need supports for the tusks, the lower jaw, and some parts of the teeth. The .3mf file also includes some supports inside the mouth, which

can be removed from the side with needle nose pliers. I used the special "Support for PLA" from Bambu Lab for the dense interface layers. The results are great, but the prime tower was a bit messy.

You can also print it sitting on the diagonal beam below the jaw to reduce supports a bit. But then the layer lines will not be in line with the tusks, so they might break off easier.

Mounting

You need two countersink wood screws (4 mm shaft, 8 mm head). Screw them into the mounting plate exactly 50 mm apart, on a vertical line. You can use the `Screw_Test_Fit.stl` to see if your screws fit, and the `Coat_Hanger_Screw_Hole_Template.stl` to mark the screw locations.

Leave the screw heads sticking out a bit (see photo). Then put the coat hanger on the screw heads, and try to slide it downward. It should go down with a bit of force, so that it sits snugly to the wall. If it is too loose, screw the screws in further. If it does not slide down, screw them back out a bit. Repeat until you are satisfied.

License

The original model is non-commercial, so this one is as well.

This model is also available on Thingiverse.
