---

A simple scraper used to remove objects off your buildplate.

When the blade is worn out just print a new one and attach instead of printing an entire scraper each time.

For ease of use i decided to make it a click in blade instead of something that locks in place, its not as sturdy as a lock in place design but i havent been able to knock a blade off so i think its strong enough. :)

Important! Let the blade cool fully before attaching it to the handle otherwise it will easily deform.

Use standard printing settings, 0.2mm layer height, 0.4mm line width, if you want a very sharp blade you could use adaptive layers and make the bottom layers 0.1mm layer height.
