I modelled this CATch all tray (haha :P) via Fusion 360. This is my first time using the program but it printed decent. The top space can be used to store wallets, phones, coins etc.

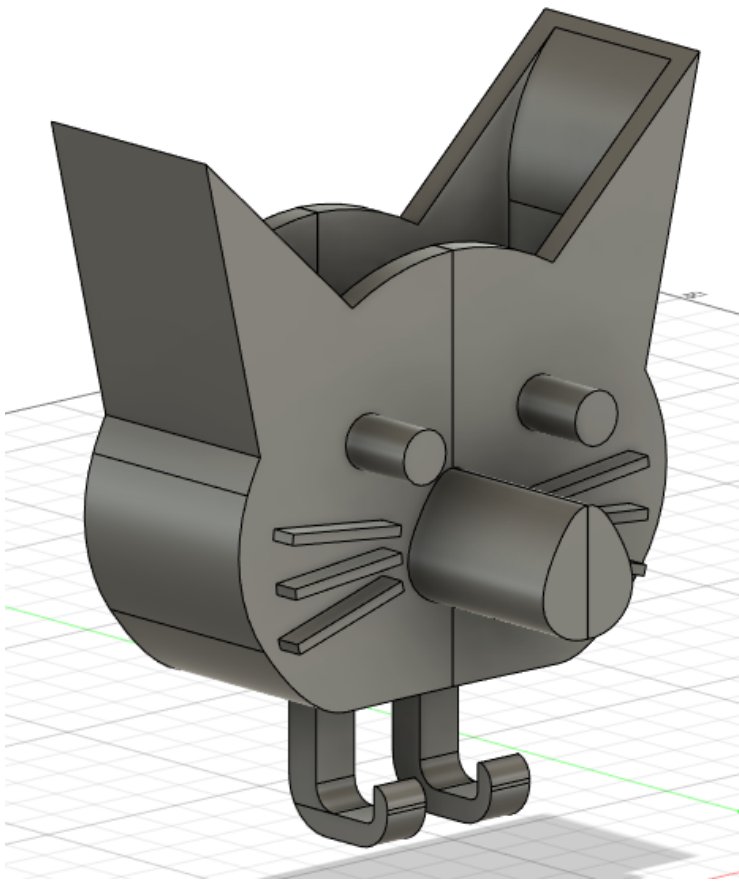

Print settings:

Speed: 60mm/s

Infill: 10% (I would probably go higher but 10% worked for me)

Material: PLA+ Silk Pink

Supports: yes (I would recommend manual supports. Tree supports made it really difficult to remove properly - this may just be my settings tho :P)

Filament use: 93g without supports

Build Plate Adhesion: none

Time to print: 8H with the above settings on my Kobra
