Updated version of **5g Creatine Scoop v3**. The volume of the cavity still holds exactly 5g. The handle was lengthened and returned to the original shape from v1. Perforated handle allows for strength and saving material. The lip of the scoop is thinner which makes it easier to scoop and saves material when printing. Smooth interior and exterior by combining 0.1 layer height with scarf seams settings. Two versions of the design are available.

v4.0: Cone inner shape allows for printing with no support. Regular handle placement. The provided modifier can be used to customize the pattern of the handle using per object settings (set top and bottom layers to 0 and play with infill patterns).

v4.1: Cone-shaped inner cavity prints without support upside down. The handle is thick and sturdy while using very little material. Tapered bottom outer shape for a simple classic scoop design.

Slicer advice:

- 0.1mm layer height.
- 0.5mm line width (perfect for 2 wall perimeters).
- Scarf seam.
