There are many question mark models out there, but I created this one to hold only cartridges (no SD cards) and it fits together uniquely without the need for glue. You rotate each of the white question mark panels into place, which hold against each other with friction. The inner piece locks everything together.

The look and style of this question mark block closely resembles the blocks at Super Nintendo World at Universal.

I printed at stock settings on a Prusa Mini+. The main body requires supports everywhere, but the other pieces can be printed without supports. Even the insert can be printed upside down without supports just fine. There are overhangs deep in the cartridge-wells, but it doesn't negatively affect the print.
