I've been wanting one of these extremely rare German made mid-century mantle clocks but they are really difficult to find and when you do find them they go for \$1,000 - \$2,500. So I decided to try and 3D print a replica. While not perfect, I like how it turned out.

Printed on p1p. For fake wood appearance I did some sanding, then automotive body filler/primer. Then light brown colored spray paint with dark wood stain brushed on for the final coat.

For the face of the clock, use ironing to make for a smoother finish. For the clock body, use adaptive layer height for best results.

I used a cheap clock movement from Hobby Lobby as the clock internals.
